Pelvic Floor & PT referrals

Often during pregnancy and childbirth, pelvic floor muscles can be stretched and sometimes damaged. This can lead to functional problems of the pelvic floor which can include urinary incontinence, fecal incontinence, pelvic organ prolapse, pain with sexual activity, low back pain, pelvic pain, or diastasis recti (separation of the abdominal muscles). Luckily, these issues can be treated through pelvic floor physical therapy once you are cleared after your 6-8 week postpartum checkup. The pelvic floor therapy session depends on your complaints or goals but may include strengthening exercises for the pelvic floor, legs or abdominal muscles, stretching or relaxation exercises, scar massage, coordination exercises, behavioral modifications and education, or biofeedback. Below is a list of local options for pelvic floor physical therapy that we may suggest.
